

A decorative graphic on the left side of the slide, consisting of a network of orange lines and circles that resemble a circuit board or a data network. The lines are of varying thickness and connect to small circles, creating a complex, branching structure.

# PROJECT VISION – WHAT IS CYSAT?

- 3U Cube Satellite built by ISU Students
- Orbit earth for 6 months
- Collect soil moisture data and relay the data back to earth

# CONCEPTUAL/VISUAL SKETCH

# FUNCTIONAL REQUIREMENTS

- Must power up no earlier than 30 minutes after deployment from the International Space Station
- Must stabilize and point itself towards earth for data collection
- Must take soil moisture readings from Earth via a microwave radiometer
- Must be capable of transmitting SDR data back to the ground station in Ames, IA at a rate of 400 kb per week while within 500km of the Ground Station
- Must operate battery heaters based on the current operating temperature so as to prevent battery charging at temperatures below  $0^{\circ}\text{C}$
- Must disable 3.3 V and 5 V outputs if the operating temperature is greater than  $55^{\circ}\text{C}$  or if battery voltage falls below 3.5 V

# FUNCTIONAL REQUIREMENTS CONT'D

- Must collect data for its orbit life, a minimum of 2 months and a maximum of 6 months
- Must meet NASA's CubeSat standards and regulations
- Must receive and execute commands issued by the Ground Station while within beacon range (500 km)
- Ground Station must keep logs of sent/received commands and data, separated daily or weekly
- Must successfully deorbit at the end of its lifespan, estimated to be 221 days
- Must begin detumbling when total orbital spin exceeds 40 rads/second

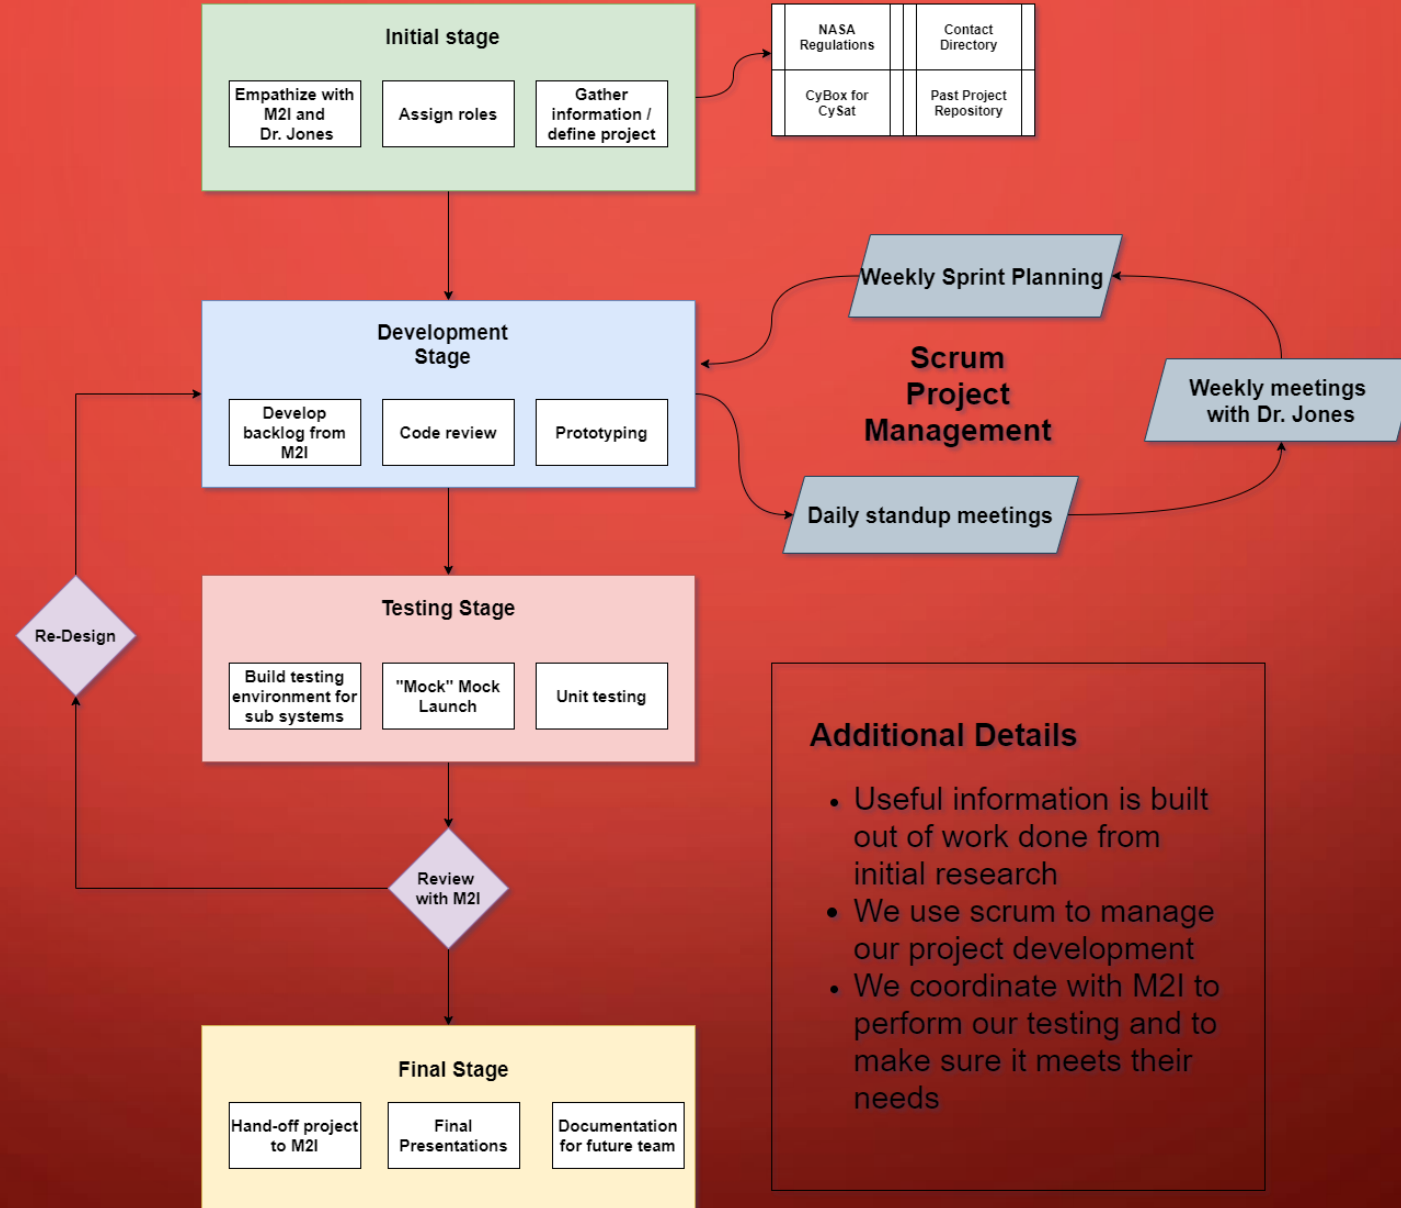

# NON-FUNCTIONAL REQUIREMENTS

- Ground Station UI must be performant and fault tolerant (minimal downtime, error recovery)

# CySat Team Process

## Useful information

NASA Regulations	Contact Directory
CyBox for CySat	Past Project Repository

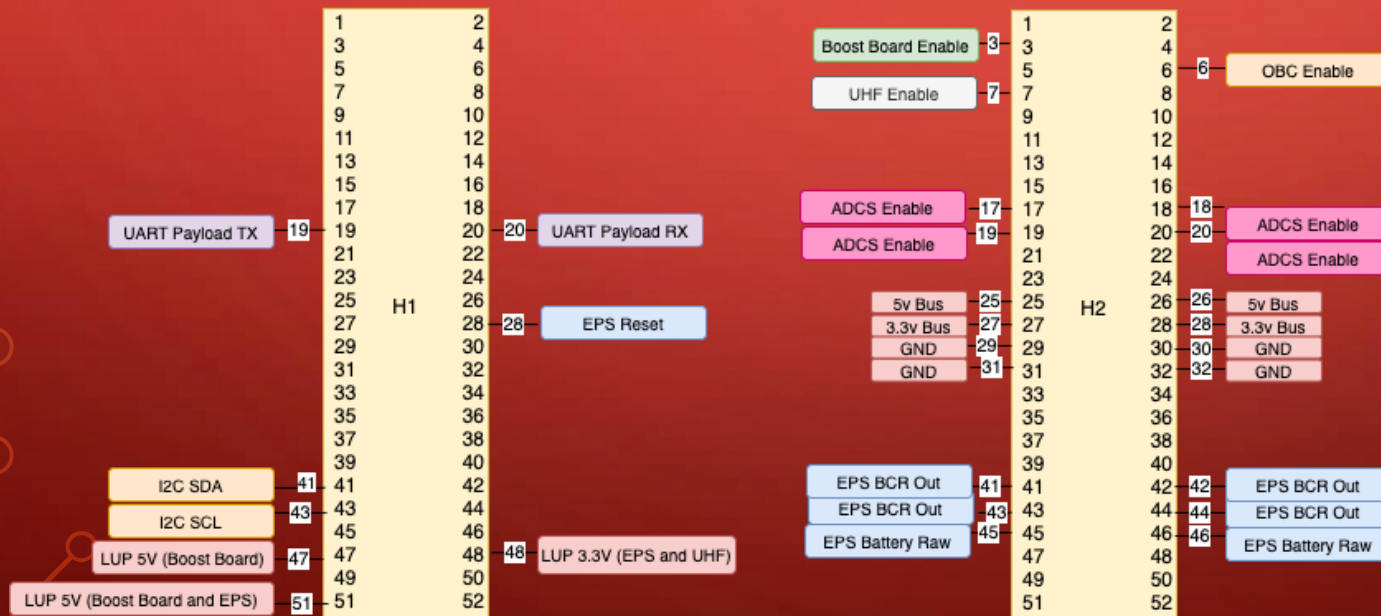

The background is a solid dark red color. In the four corners, there are decorative elements consisting of thin, light red lines that resemble circuit traces or a network diagram. These lines connect to small, hollow circles, creating a sense of connectivity and technology.

# PROJECT PLAN

## MILESTONES / DESIGN

# ON-BOARD COMPUTER(OBC)

- Why Endurosat OBC?
- Communication with Interrupts
- Bootloader for Live Patches

# OBC DEMO

The image shows a screenshot of a code editor displaying C code. The code is organized into several functions: `main`, `HW_UART_Receive`, and `HW_I2C_MasterReceive`. Comments indicate that the I2C module is commented out for this demo. The code uses the `printf` function to output data from the UART and I2C modules.

```
200 // HW_UART_Receive
201 #if (HW_UART_ClockConfig == HW_UART_CLOCK)
202     Error_Handler();
203 #endif
204
205 // HW_I2C_MasterReceive
206 #if (HW_I2C_ClockConfig == HW_I2C_CLOCK)
207     #error "I2C is not implemented in this demo"
208 #endif
209 #else
210     #error "I2C is not implemented in this demo"
211 #endif
212
213 // HW_UART_Receive
214 void HW_UART_Receive(uint16_t *Data_ptr, uint16_t Data_len)
215 {
216     #if (HW_UART_ClockConfig == HW_UART_CLOCK)
217         //HW_UART_Receive(USART1, Data_ptr, Data_len);
218     #else
219         #error "UART is not implemented in this demo"
220     #endif
221 }
222
223 // HW_I2C_MasterReceive
224 void HW_I2C_MasterReceive(uint16_t *Data_ptr, uint16_t Data_len)
225 {
226     #if (HW_I2C_ClockConfig == HW_I2C_CLOCK)
227         //HW_I2C_MasterReceive(I2C1, Data_ptr, Data_len);
228     #else
229         #error "I2C is not implemented in this demo"
230     #endif
231 }
232
233 // Error_Handler
234 void Error_Handler(void)
235 {
236     /* USER CODE BEGIN Error_Handler_Debug */
237     /* user can add whatever he wants to be done here if he wants
238     * the program to continue in case of a HAL error.
239     * It will be called if hal_error_callback() is called
240     * inside HAL_Error_Handler()
241     */
242     /* USER CODE END Error_Handler_Debug */
243 }
```

# GROUND STATION

- Ground Station Communication
- Ground Station Command Protocol
- Data and Command Logging
- Subsystem Health Visualization
- User Testing (Ongoing)

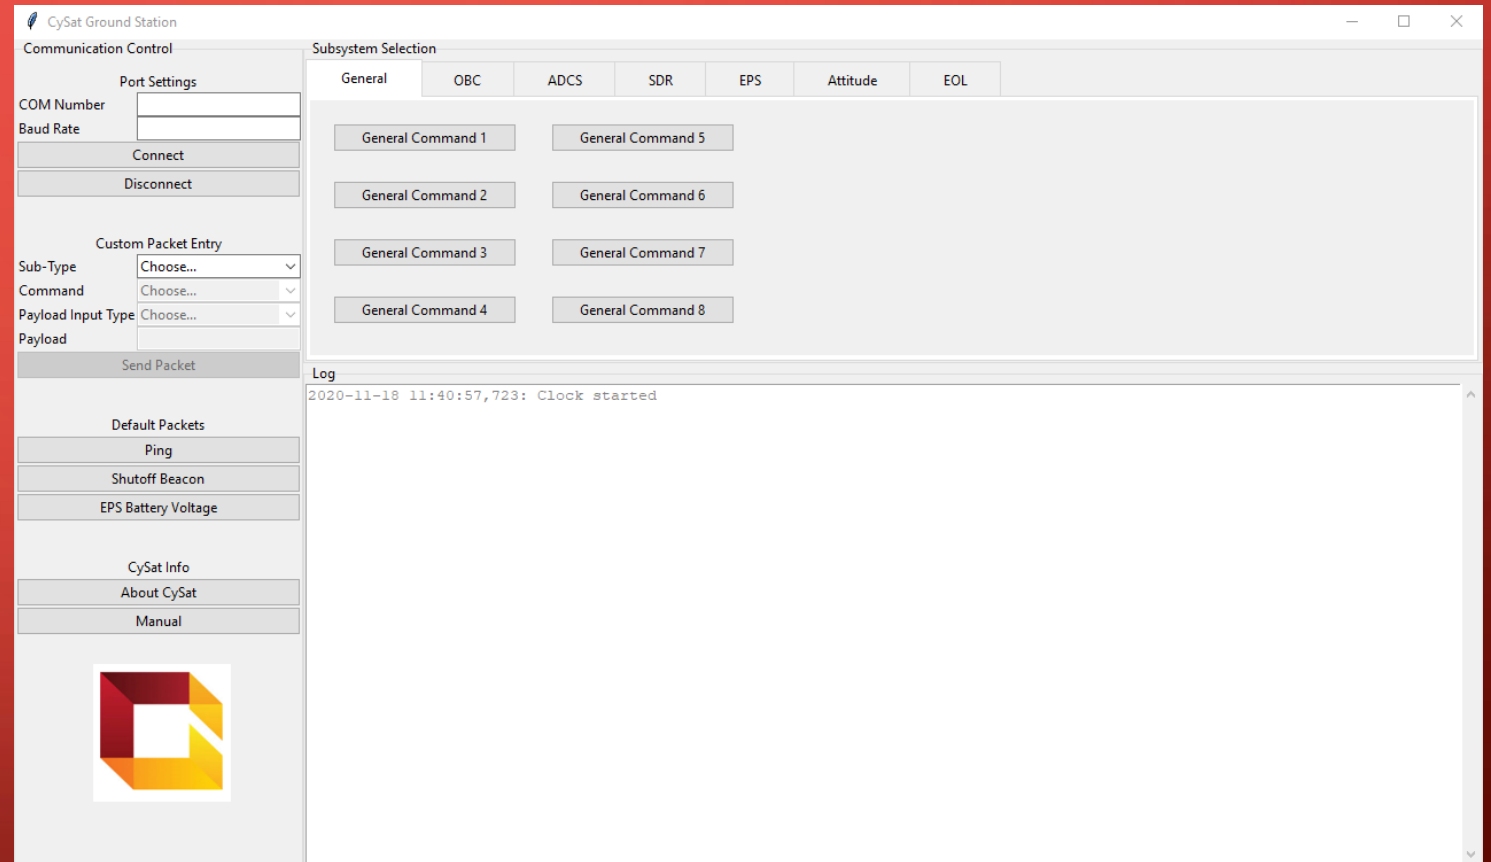

## CySat Packet Protocol

- Ensures data consistency
- Longitudinal Parity or CRC Checksum

Start Character 0xff	Subsystem Type (1 byte)	Command (1 byte)	Data Length (1 byte)	Data (N bytes)	Checksum (1 byte)
-------------------------	----------------------------	---------------------	-------------------------	-------------------	----------------------

# GROUND STATION PROTOTYPE

- Ground Station UI Wireframed and Partially Implemented by Previous Team
- Serious rewrite necessary

# ULTRA-HIGH FREQUENCY RADIO(UHF RADIO)

- Communication from computer into radio for debugging
- Establish connection between Kenwood and UHF
- Communication with Ground Station
- Receive and Send commands to OBC
- Receive and send packets from Ground Station and OBC

```
===== PuTTY log 2012.11.13 13:47:12 =====  
ES+R2201 CA8FBE89  
OK+0076620F41
```

# ELECTRICAL POWER SYSTEM (EPS)

- EPS Communication with OBC via I2C
- Health Checks
- Charge and Discharge
- Battery Protection
  
- 3.3V and 5V outputs
- Solar panels fabricated by M:2:I

# EPS COMMUNICATION FORMAT

Figure 2a: Typical I2C READ Command Communication (e.g. "Battery Voltage", Command 1)

Figure 2b: Typical I2C WRITE Command Communication (e.g. turning ON the "Out 1")

# SOFTWARE DEFINED RADIO PAYLOAD(SDR PAYLOAD)

- Communication with OBC
- Data Collection Testing
- Payload Functionality Integration with OBC

# ATTITUDE DETERMINATION AND CONTROL SYSTEM (ADCS)

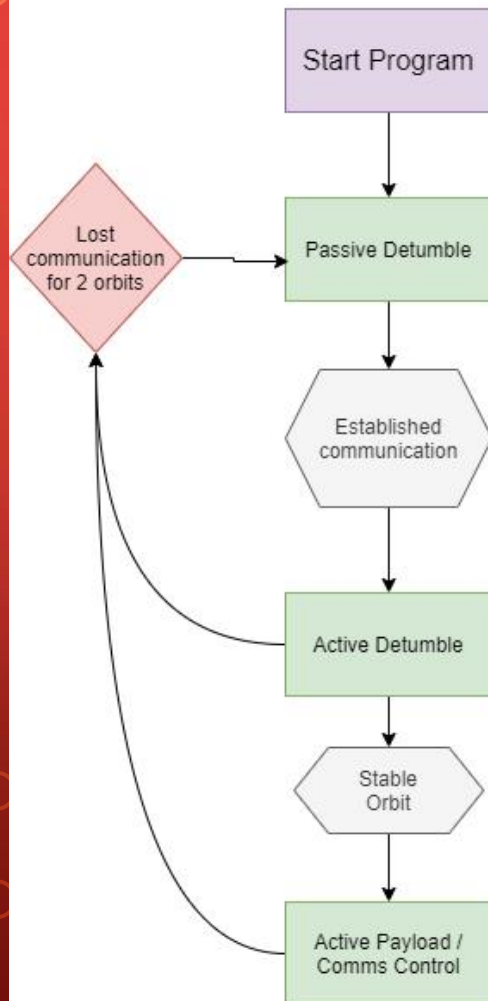

- Orientation of the Satellite
- Storage of Telemetry Data
- Mode Activation Control
- I2C Communication

S	0xAE	TC ID	TC data 0	...	P
	Master writes node address (write operation)	Master writes telecommand ID	Master writes data bytes		

# ADCS MODE CONTROL

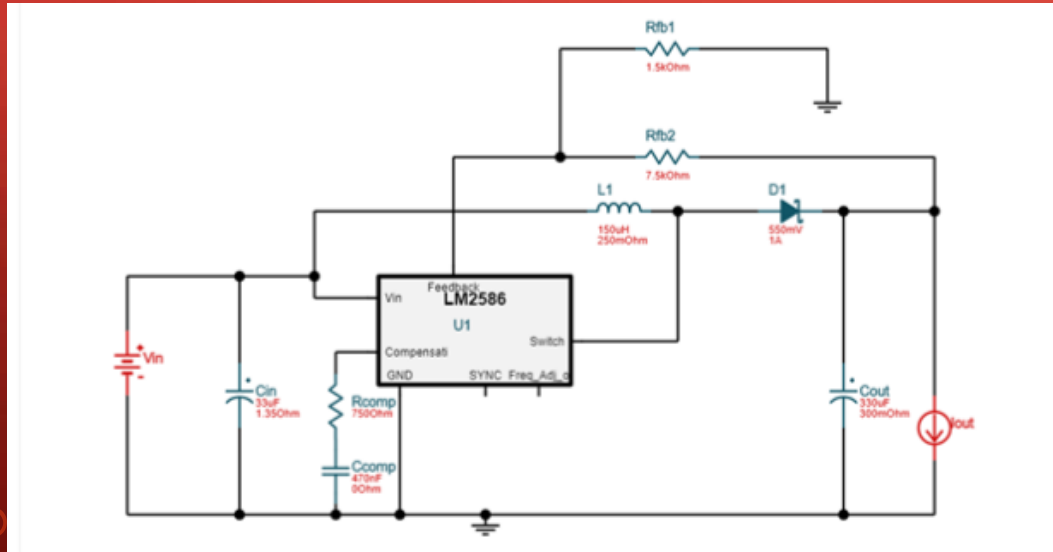

## High level mode workflow

Part	Order #	Step	Page
Passive Detumble (1)	1	Determine initial angular rates	3
Passive Detumble (1)	2	Initial detumbling	4
Passive Detumble (1)	3	Continued detumbling to Y-Thomson	5
Active Detumble (2)	4	Magnetometer deployment	6
Active Detumble (2)	5	Magnetometer calibration	7
Active Detumble (2)	6	Angular rate and pitch angle estimation	8
Active Detumble (2)	7	Y-wheel ramp-up test	9
Active Detumble (2)	8	Initial Y-momentum activation	10-11
Active Detumble (2)	9	Continued Y-momentum activation and magnetometer EKF	11
Active Detumble (2)	~	Adjusting settings to increase Y-momentum performance	12
Active Detumble (2)	10	CubeSense sun/nadir commissioning	13
Active Detumble (2)	11	EKF activation with sun and nadir measurements included	13
Active Detumble (2)	~	Adjusting settings to troubleshoot sun/nadir sensor parameters	14
Active Detumble (2)	~	Image capturing, saving, and downloading of CubeSense image	14
Active Overpass/Payload/Comms Control (3)	12	Adjust pitching angle for payload data and/or better communication	15
Active Overpass/Payload/Comms Control (3)	13	Updating satellite data and monitoring errors	16

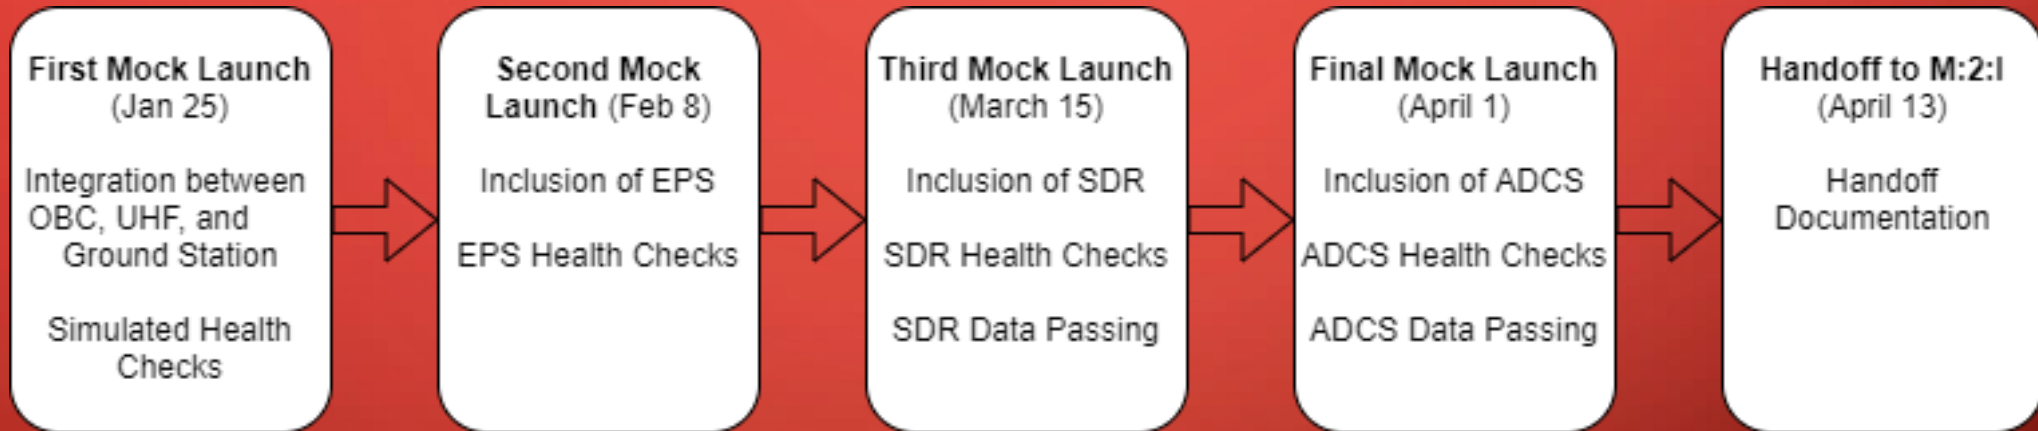

# VOLTAGE BOOST BOARD

- Construction and Testing

# TEAM MILESTONES

# TEST PLAN

- Subsystem integration will be tested by performing a series of mock launches, which simulate the ejection of the satellite up until the initial health check
- The Ground Station and other subsystems will write unit tests to ensure adherence to communication protocol and packet encoding/decoding
- The Boost Board will be tested by connecting a dummy load and measuring the current for an extended period

# EFFORT HOURS

Substem	Task	Description	Hours Estimated	Hours Completed	Projected Completion %
Ground Station	Review and Test of Current Capabilities	Check status of Sending, receiving, interpreting, and responding to data	20	20	95%
	Common Command Implementation	Implementation of common commands to be sent to CySat	20	10	75%
	Write logged packets sent/received to file	Permanent storage of command sent/received and system logs	15	0	0%
	Write logged data to file	Permanent storage of payload data	15	0	0%
	Ground Station Visualization Capabilities	Visualization of Satellite/Subsystems	15	0	0%
	Ground Station End User Testing (Ongoing)	User testing of Ground Station with M:2:I	30	0	0%
--	--	Total hours for Ground Station	115	30	28%
UHF Radio	Receive and send packets from computer into radio for debugging	Hello world, Packet structure, additional functional	30	30	100%
	Establish connection between Kenwood and UHF	Kenwood to UHF Beacon communication	25	6	10%
	Communication with Ground Station	Ability to receive packets sent from Ground Station	15	0	0%
	Receive and send commands to OBC	Line of communication between the satellite and its users	25	0	0%
	Receive and send packets from Ground Station and OBC	Integration between OBC and Ground Station communication	25	0	0%
--	--	Total hours for UHF Radio	120	36	30%
Payload	Transfer mode/capture mode of SDR	Sending/collecting data via the SDR	20	0	0%
	Communication to/from OBC	Being able to send or receive data between SDR & OBC	45	15	50%
	Radiometer application work	Getting application to run on embedded Linux start up	10	0	0%
	Coding OBC functionality with SDR	Programming the OBC to be able to command the SDR using UART	20	0	0%
	Coding OBC functionality with UHF antenna	Programming the OBC to transfer data using the UHF antenna	20	0	0%
--	--	Total hours from Payload	115	15	10%
ADCS	Initial rate estimation	Backup and verification of the Kalman filter output	12	2	30%
	Detumbling	Reduce the total rotation velocity	12	2	30%
	Mode activation control	Major component of programming the ADCS, flow control for op modes	40	20	27%
	Magnetometer deployment	Limit the magnetic disturbances caused by the satellite bus	12	2	30%
	Y-momentum mode activation	The mode used for initial commissioning attempts	12	0	0%
	Sun/Nadir sensor test	Testing of sun sensor for determining position	12	0	0%
	Angular rate and pitch estimation	Estimate the values from magnetometer measurements	12	2	30%
Set magnetometer configuration	Compute magnetometer offset and sensitivity matrix	15	2	20%	
--	--	Total hours for ADCS	127	30	22%
EPS	Communication to/from OBC	Update I2C to new version	40	10	25%
	Health check	New I2C protocols add more parameters to be checked	25	5	20%
	Charging and discharging	Measure and calculate the energy v. time of the batteries	30	3	10%
	Battery protection	Change operation based on the data from the health check	15	0	0%
--	--	Total hours for EPS	110	18	16%
OBC	Communication to all Subsystems	Sending, receiving, interpreting, and responding to all other subsystems	30	0	0%
	Optimization	Use interrupts for UART and I2C	30	15	75%
	Live Updates	Create bootloader that allows for live patches	30	0	0%
	Land Tests	Implement mock mock launch, mock launch, and mock mission	50	0	0%
--	--	Total hours for OBC	140	15	19%
Voltage Boost Board	Soldering	Solder Components on Fabricated PCB	10	0	0%
	Testing	Testing for 5V to 7.4V Amplification	10	0	0%
	--	--	Total hours for Voltage Boost Board	20	0

# CONCLUSION

- Mission Design
- On schedule for the April launch date
- Continued progress during the winter term
- Team Progress
- Team Challenges

A satellite is shown in orbit above Earth. The satellite is a rectangular box with several panels and antennas. The Earth's surface is visible below, showing clouds and landmasses. The moon is visible in the dark sky above. The background is a deep blue and black space.
